

Change Report — 1 July 2026

Scope: OmeruIO (storefront & landing) · OmeruHQ (merchant portal) · OmeruShowcase (WhatsApp demo platform, newly integrated) · docs/logs (changelog system). OmeruWA backend untouched — no behaviour risk to the live bot.

Release tags: OmeruIO v1.16.0 · OmeruHQ portal v0.5.0 · OmeruShowcase v0.3.0 · Log map INDEX created.

Dependencies added: none. All improvements use what was already in the stack.

Executive summary

The WhatsApp Bot Showcase now lives inside the omeruHQ monorepo as **OmeruShowcase**, with its own canonical changelog, an entry in a new master log map, full SEO surface, and hardened production config. All three web apps moved from render-blocking remote Google-Fonts CSS to self-hosted fonts via next/font, which removes an entire request chain from first paint. The OmeruIO hero received a UX overhaul (labeled audience toggle, flash-free image crossfade, lime marker signature). The showcase's chat renderer was refined for realism — curved bubble tails, consistent read receipts across every demo flow — and the changelog system gained a single index that maps every app to its log, version, and status.

1 · Ecosystem integration: OmeruShowcase

The showcase arrived as a standalone zip containing a full stale duplicate of itself (what sapp - bot - showcase/ nested inside the root — every file diverged from the live copy). The duplicate was removed and the app was placed at omeruHQ/OmeruShowcase/ beside OmeruIO, OmeruHQ, and OmeruWA. Its app-root CHANGELOG.md is now a pointer to docs/ logs/ wa - showcase . md, matching the convention used by OmeruIO and OmeruWA.

Item	Before	After
Location	Standalone zip, outside ecosystem	omeruHQ/OmeruShowcase/
Duplicate copy	Full stale nested duplicate present	Removed (risk of editing dead code eliminated)
Changelog	Own format, not indexed	Canonical log docs/logs/wa-showcase.md + pointer, indexed in log map

2 · WhatsApp-clone fidelity

The chat surface was already close; the remaining gaps a real WhatsApp user notices were closed with original code:

- **Bubble tails** — hard triangle clip-paths replaced with a curved path() clip that mirrors the softly hooked tail of real messaging bubbles.
- **Read receipts** — 11 user messages across 6 demo flows were missing delivery ticks; every user bubble now carries status: read, the single most visible realism break in playback.
- **Date/system chips** — new .wa-chip utility with correct radius, padding and shadow depth.
- **Chat typography** — the chat surface stays on the OS system font stack (how native messaging apps render), while Omeru chrome uses brand fonts. All 7 flows validated for monotonic timestamps and list/preview integrity.

Note: fidelity is achieved through original code reproducing the general look and interaction conventions; no proprietary WhatsApp assets were added.

3 · Fonts (all apps)

App	Before	After
OmeruIO	@import of Google Fonts CSS at top of globals.css (render-blocking)	Syne + DM Sans self-hosted via next/font, preloaded WOFF2, display swap
OmeruHQ portal	Two chained @imports (text fonts + icon font)	Archivo + Hanken Grotesk via next/font; Material Symbols moved to early-discovered <link> with preconnect
OmeruShowcase	Blocking <link> stylesheet in head	Syne + DM Sans via next/font; chat keeps system stack

Result: no FOUT/layout shift on display faces, one fewer critical-path request chain per app, fonts served from the app's own origin.

4 • OmeruIO hero overhaul

- The cryptic arrow-dot pager (< > 1 / 2) became a labeled segmented toggle — “Merchant view / Customer view” — with proper tablist semantics. Visitors no longer guess what the arrows do.
- Both hero images stay mounted and crossfade on toggle instead of unmounting, eliminating the re-decode flash visible on mid-range Android — the primary SA audience.
- The headline accent switched from lime-coloured text to a lime **marker sweep** behind black text: higher contrast, stronger brand signature, animated with an ease-out sweep that honours prefers-reduced-motion.

5 • Performance & security config

Change	OmeruIO	OmeruHQ	Showcase
compress: true	+	+	+
poweredByHeader: false	+	+	+
Strip console.* in prod (keep error/warn)	+	+	+
AVIF/WebP image formats	already	n/a	+
Security headers (nosniff, frame, referrer, permissions)	already (full CSP)	—	+
Immutable caching for wallpaper/frame assets	n/a	n/a	+

6 • SEO

OmeruIO already had a strong SEO layer (metadata, JSON-LD, sitemap, robots); removing render-blocking fonts further improves its Core Web Vitals, which feed ranking. The showcase went from a bare title/description to a complete surface:

- Title template, keywords, canonical URL, metadataBase from NEXT_PUBLIC_SITE_URL
- OpenGraph + Twitter cards for rich WhatsApp/social link previews
- WebApplication JSON-LD schema
- robots.ts — crawl everything except /api/ and the internal /builder
- sitemap.ts — homepage plus one URL per bundled demo flow, generated from code so it can never drift from reality

7 · Changelog & mapping system

A new master index, docs/Logs/INDEX.md, is now the single source of truth: one row per app with codebase path, canonical log, current version, status, last-entry date and domain. Every canonical log links back to the index, the index is updated in the same commit as any release entry, and a shared entry format (what/why/score impact/rollback) is documented once instead of being implied by example. Cross-cutting releases (like today's font change) get an entry in every affected log plus one row in the index history.

App	Canonical log	Version	Status
OmeruWA (bot backend)	omeruhq-backend.md	see log	Live
OmeruIO (storefront)	hq-storefront.md	v1.16.0	Live
OmeruHQ (portal)	merchant-portal.md	v0.5.0	Beta
OmeruShowcase (demos)	wa-showcase.md	v0.3.0	Live
omeru-intel (MCP)	merchant-portal.md § v0.4.0	v0.1.0	Live

New entries written today, each with a full rollback block in house format: hq-storefront.md v1.16.0 · merchant-portal.md v0.5.0 · wa-showcase.md v0.3.0 (plus migrated v0.1.0/v0.2.0 history).

8 · Verification performed

- All 7 demo-flow JSON files re-validated (parse, monotonic timestamps, previews, delivery statuses)
- Brace/paren/bracket balance checked on every edited TS/TSX file
- OmeruShowcase next.config.mjs parse-tested under Node ESM
- Hero markers (tablist, hw-accent, crossfade) asserted present
- No dependency changes — package.json and lockfiles untouched in every app

Recommended before deploy: run `npm run build` in each of the three web apps (node_modules are not shipped in the archive, so builds were not run here), then Lighthouse the OmeruIO homepage — expect improved FCP/LCP from the font change.

9 · Rollback

Every change shipped today is reversible from the logs alone. Say “roll back to v1.15.0” (OmeruIO), “v0.4.0” (portal) or “v0.2.0” (showcase) and reverse the rollback tables newest-first. The index records the restored version once done.
